

Scenario 3: Forty aircraft on approach

Slug: seatac-ground-stop - **Repo:** github.com/joelcapgemini/titan-watch-seatac - **Your role:** incident commander, next page

The kaiju, in thirty seconds

- **Vespyra.** Airborne, 98 m, 62 km/h, faster into storms. Heading for Bellevue through the Sea-Tac approach corridor. Does not turn for aircraft. Does not stop. Cannot be stopped.
- **19 minutes** until it crosses the outer marker for runways 16L, 16C, 16R. Straight-line estimate from Titan Watch, refreshed every 30 seconds. Usually runs early.
- **Anything within 2 km of its track is lost.** Wake and debris, not intent.
- **Who sees it.** Titan Watch sees where it is, every 30 seconds. Radar sees a blip. Pilots see it inside 15 km in daylight. Nobody sees what it does next. That gap is the scenario.

Forty aircraft are inside approach airspace. Land them onto runways in its path, or divert them with fuel some do not have.

Outcome, same for every scenario

Save as much human life as possible, then prevent as much public property damage as possible, in that order. A software tool is expected to come out of this.

You are graded on, in this order: people killed or injured on the forty aircraft and on the ground; aircraft lost, in the air or on a runway; damage to Sea-Tac itself, runways first; and whether every decision you made was a decision, recorded, with a name on it.

The coach interviews you against this, narrows it to this clock and this landmark, and restates it after synthesis. The original stays in the scope file beside the restatement.

Who reports to you

Nine specialists have already been interviewed. Their interviews are in .copilot-tracking/dt/seatac-ground-stop/. Do not read them. The coach has, and will quiz you on what they said.

Reports to you	What they own	What they keep saying
FAA tower supervisor	Landing clearances	"Landed means done." Nobody has checked
TRACON approach controller	Sequencing, headings	Cannot see fuel; the real choice is which eight land here
Airport duty manager	Runways, ground	Twenty in fifteen minutes, never timed
Airline operations	Fuel, crew, 14 of the 40	Knows in thirty seconds, nobody asks
Fire and rescue chief	Crash staging	Can cover two runways, hears everything third-hand
Titan Watch analyst and liaison	The clock	19 is really 15; no line to the FAA
FAA command centre	National ground stop	Wrong tool for aircraft already airborne
Portland divert field	Divert capacity	Fifteen gates, nobody has called
A captain on final	One aircraft, 162 people	Silence means land

Already done, do not redo

Scope, stakeholder map, assumptions log, world rules, nine interviews, security scoping answers. All under .copilot-tracking/dt/seatac-ground-stop/. The coach reads them.

Out of scope for everyone: engaging Vespyra, terminal evacuation, anything after it passes.

Your card: Incident commander, Sea-Tac

Scenario 3, Sea-Tac. Kaiju facts are on page 1 of this pack. Human facts are yours: invent and label.

Outcome: save as much human life as possible, then prevent as much public property damage as possible, in that order. The coach narrows it; that is fine.

Slug: seatac-ground-stop-commander

Who you are

The person every specialist reports to and nobody has formally appointed. Airport, FAA, airlines and Titan Watch each run their own piece. You are the one who has to make the call that none of them owns. You decide. You cannot act; they act.

Who you can call, and for what

- Tower: what is on final, landing clearances.
- Approach: where every aircraft is, sequencing, go-arounds.
- Duty manager: runways, ground crews, how many the airport can take.
- Airline ops: fuel and crew limits, their fleet only.
- Fire and rescue: what they can cover.
- Titan Watch liaison: the clock, and how stale it is.
- FAA command centre: a national ground stop, slowly.
- Portland: divert capacity.

Each one sees a piece. You see what they tell you, when they tell you. One wall clock.

What you cannot see

- Any screen of your own. No radar, no threat board, no fuel system.
- Anything a specialist has not reported yet.

Your scope

In scope, you decide:

- Whether to order a ground stop, and when.
- Which aircraft land here and which go elsewhere, when the specialists disagree.
- When to stop trying to save everything and start choosing.

Out of scope, you hand off:

- How a runway is cleared, how an aircraft is sequenced, which captain is called. The specialists.
- Where Vespyra is. Titan Watch.

Anchors, fixed

- Nobody has written down that you have this authority. Three agencies each think the call is theirs.
- Every report reaches you through at least one other person, late.

Three phrases

"I do not know." - "Assume and label it." - "That is not my call. Ask the specialist."

Your prompt

/clear, then /hve-core:dt-coach, then paste:

```
Resume project seatac-ground-stop. Scope is done under
.copilot-tracking/dt/seatac-ground-stop/; read it, including every interview
there, do not redo it. I play the incident commander: the specialists in those
interviews report to me, I see only what they report, I decide and they act.
Interview me as that role, five questions, using what the specialists said.
```

Then write `interview-commander-roleplay.md` under slug `seatac-ground-stop-commander`. Label everything role-play. Expect a software tool. Do not offer the canonical deck.

After your interview

Commit locally. Do not push. Then run the synthesis prompt from the shared instructions, Section 1.
