

CAPGEMINI FDE - HVE TRAINING

The Kaiju Lab, role cards

Scenario 3: forty aircraft on approach - one card per person

Repository: github.com/joelcapgemini/titan-watch-seatac

Contents

- Card 1: Airport duty manager (lead)
- Card 2: TRACON approach controller (security driver)
- Card 3: Airline operations controller (RAI driver)
- Card 4: Titan Watch liaison (reviewer)
- World rules: fixed monster facts

Derived from The Kaiju Lab v1.0 (Sumer Verma, 7 October 2026). Capgemini internal. The sample application is MIT licensed; the scenario is fiction and contains no client material.

Card 1: Airport duty manager, Port of Seattle

Scenario 3: forty aircraft on approach. Vespyra crosses the Sea-Tac approach corridor in 19 minutes. Monster facts: world-rules.md, fixed. Human facts: yours, invent and label.

Your duty on this card: lead. You merge the pull requests, run the synthesis, and drive the RPI session.

Outcome you are judged on: every aircraft on the ground somewhere before Vespyra crosses the outer marker.

Slug: seatac-ground-stop-duty-manager

What you can see

- Runway status, ground crews, gate availability, from the airport operations centre.
- Radio to the tower, fire and rescue, and ground operations.
- The Titan Watch liaison, who sits in your room.

What you cannot see

- Aircraft in the air. Approach owns that.
- Fuel state of any aircraft.
- Vespyra, except what the liaison tells you.

Your scope

In scope, you decide:

- Which runways are open and in what order they are cleared.
- Where ground crews and fire and rescue stage.
- When the airport declares it cannot take more arrivals.

Out of scope, you hand off:

- Land versus divert for any aircraft. Not yours; FAA or approach.
- Anything about Vespyra's track. Titan Watch.
- Fuel or crew limits. Airline ops.

Anchors, fixed

- You have three runways. Two are usable together in poor visibility.
- Your mass-diversion plan was written for volcanic ash and has never run against a clock.

Three phrases

"I do not know." - "Assume and label it." - "That is not my call. Ask the tower." (or approach, or airline ops).

Your prompt

/clear, then /hve-core:dt-coach, then paste:

```
Resume project seatac-ground-stop. Scope is done under
.copilot-tracking/dt/seatac-ground-stop/; read it, do not redo it. I play the
airport duty manager, Port of Seattle. Interview me as that role, five
questions, then write interview-duty-manager-roleplay.md under slug
seatac-ground-stop-duty-manager. Label everything role-play. Expect a software
tool. Do not offer the canonical deck.
```

After your interview

- 1 git checkout -b <cohort>/duty-manager, commit, push, open a pull request with base team/<cohort>, never main.
- 2 Merge all four pull requests into team/<cohort>. Fewer than four people? Copy the missing card's file from lab/fallback/ into the matching slug folder first.
- 3 git pull, then run the synthesis prompt from lab/README.md.

Card 2: TRACON approach controller, Sea-Tac

Scenario 3: forty aircraft on approach. Vespyra crosses the Sea-Tac approach corridor in 19 minutes. Monster facts: world-rules.md, fixed. Human facts: yours, invent and label.

Your duty on this card: security driver. In section 2 you run the security planner.

Outcome you are judged on: every aircraft on the ground somewhere before Vespyra crosses the outer marker.

Slug: seatac-ground-stop-approach-controller

What you can see

- Radar returns for every aircraft in your airspace: position, altitude, speed, callsign.
- Voice from each cockpit, one at a time, on your frequency.
- A large erratic primary return that is not an aircraft.

What you cannot see

- Fuel state. You ask each pilot and wait for the answer.
- Vespyra's projected track. Titan Watch owns that and you are not on their board.
- Runway surface or ground readiness.

Your scope

In scope, you decide:

- Sequence, heading and altitude for every aircraft in approach airspace.
- Who goes around and who holds.
- Which aircraft are sent toward a divert field once a divert is ordered.

Out of scope, you hand off:

- Whether a ground stop or divert is ordered at all. FAA command centre.
- Whether an aircraft has the fuel for the divert you give it. Airline ops.
- Landing clearance on the runway. Tower.

Anchors, fixed

- 40 aircraft in your airspace. 12 are on final and will land or go around regardless.
- A ground stop takes 4 minutes to reach every cockpit.

Three phrases

"I do not know." - "Assume and label it." - "That is not my call. Ask airline ops." (or the tower, or Titan Watch).

Your prompt

/clear, then /hve-core:dt-coach, then paste:

```
Resume project seatac-ground-stop. Scope is done under
.copilot-tracking/dt/seatac-ground-stop/; read it, do not redo it. I play the
TRACON approach controller. Interview me as that role, five questions, then
write interview-approach-controller-roleplay.md under slug
seatac-ground-stop-approach-controller. Label everything role-play. Expect a
software tool. Do not offer the canonical deck.
```

After your interview

- 1 git checkout -b <cohort>/approach-controller, commit, push, open a pull request with base team/<cohort>, never main.
- 2 Write three security findings you predict the planner will raise. Paper. Keep it for section 2.

Card 3: Airline operations controller

Scenario 3: forty aircraft on approach. Vespyra crosses the Sea-Tac approach corridor in 19 minutes. Monster facts: world-rules.md, fixed. Human facts: yours, invent and label.

Your duty on this card: RAI driver. In section 2 you run the Responsible AI planner in a second terminal.

Outcome you are judged on: every aircraft on the ground somewhere before Vespyra crosses the outer marker.

Slug: seatac-ground-stop-airline-ops

What you can see

- Fuel on board, crew duty time remaining, and passenger count for every aircraft in your own fleet, from the operations system.
- Which divert fields your airline has handling agreements with.
- A phone to each of your captains, one at a time, through dispatch.

What you cannot see

- Any aircraft that is not yours. There are six airlines in the forty.
- Radar. You know where your aircraft were at the last position report.
- Vespyra, Titan Watch, or the tower frequency.

Your scope

In scope, you decide:

- Which of your 14 aircraft can divert, and to where, on fuel and crew limits.
- What your captains are told, through dispatch.
- Whether to declare a fuel or medical priority for one of yours.

Out of scope, you hand off:

- Any aircraft that is not yours. The other five airlines.
- Sequencing and headings. Approach.
- Whether a divert is ordered at all. FAA command centre.

Anchors, fixed

- Your fleet is 14 of the 40 aircraft.
- At least two of yours cannot reach Portland on the fuel they have. Which two is yours to decide.

Three phrases

"I do not know." - "Assume and label it." - "That is not my call. Ask approach." (or the tower, or the other airlines).

Your prompt

/clear, then /hve-core:dt-coach, then paste:

```
Resume project seatac-ground-stop. Scope is done under
.copilot-tracking/dt/seatac-ground-stop/; read it, do not redo it. I play an
airline operations controller with 14 of the 40 aircraft. Interview me as that
role, five questions, then write interview-airline-ops-roleplay.md under slug
seatac-ground-stop-airline-ops. Label everything role-play. Expect a software
tool. Do not offer the canonical deck.
```

After your interview

- 1 git checkout -b <cohort>/airline-ops, commit, push, open a pull request with base team/<cohort>, never main.
- 2 Open a second terminal in the repo root for section 2.

Card 4: Titan Watch liaison at Sea-Tac

Scenario 3: forty aircraft on approach. Vespyra crosses the Sea-Tac approach corridor in 19 minutes. Monster facts: world-rules.md, fixed. Human facts: yours, invent and label.

Your duty on this card: reviewer. You read every file as it lands and write down one gap the coach found that nobody said. In section 3 you read the plan first.

Outcome you are judged on: every aircraft on the ground somewhere before Vespyra crosses the outer marker.

Slug: seatac-ground-stop-titan-watch-liaison

What you can see

- The Titan Watch threat board: Vespyra's position, heading, speed, and the 19-minute estimate, refreshed every 30 seconds.
- The public weather feed.
- The airport duty manager, across the room.

What you cannot see

- Any aircraft. You have no aviation display and no aviation training.
- Whether anyone in the tower or at approach has heard what you know.
- Fuel, runways, or who is in charge of the decision.

Your scope

In scope, you decide:

- What you tell the duty manager, how often, and how you phrase the uncertainty.
- When the estimate is stale enough to say "do not trust this".
- What to ask the command centre on the airport's behalf.

Out of scope, you hand off:

- Any order to anyone. You have no authority. Duty manager, FAA.
- The track model itself. Titan Watch duty analyst.
- Anything about aircraft, runways or fuel.

Anchors, fixed

- The 19-minute figure is a straight-line estimate. Vespyra accelerates into weather. There is a front south-west of the field.
- You have no authority to order anything. You can only tell the duty manager.

Three phrases

"I do not know." - "Assume and label it." - "That is not my call. Ask the duty manager." (or the FAA, or the command centre).

Your prompt

/clear, then /hve-core:dt-coach, then paste:

```
Resume project seatac-ground-stop. Scope is done under
.copilot-tracking/dt/seatac-ground-stop/; read it, do not redo it. I play the
Titan Watch liaison at Sea-Tac. Interview me as that role, five questions, then
write interview-titan-watch-liaison-roleplay.md under slug
seatac-ground-stop-titan-watch-liaison. Label everything role-play. Expect a
software tool. Do not offer the canonical deck.
```

After your interview

- 1 git checkout -b <cohort>/titan-watch-liaison, commit, push, open a pull request with base team/<cohort>, never main.

2 Watch .copilot-tracking/dt/ fill during synthesis. Write down one thing the coach said that no interview said.

World rules: Scenario 3, forty aircraft on approach

Fixed facts for this scenario. Do not invent monster facts. Human facts (how your organisation works, what you would do, what breaks) are yours to invent and label.

The kaiju

Fact	Value	Source
Codename	Vespyra	data/ roster
Archetype	Tempest Wyrn, airborne	data/ roster
Size	98 m, 41,000 t	data/ roster
Speed	62 km/h sustained, bursts higher near weather	data/ roster; burst is lore
Declared target	Bellevue	data/ roster
Current status	Critical, inbound	data/ roster
Path	Crosses the Sea-Tac approach corridor from the south-west, never changes heading for aircraft	Lore

Behaviour

- Vespyra rides storm fronts. It accelerates into weather and slows in clear air. Nobody in this scenario can predict weather better than the public forecast.
- It does not attack aircraft deliberately. Aircraft in its path are hit by wake and debris. Anything within about 2 km of its track is lost.
- It is visible on primary radar as a slow, large, erratic return. Secondary radar (transponder) shows nothing. Titan Watch's sensor grid tracks it separately.
- It does not land, feed or stop in this scenario. It transits.

The clock

- 19 minutes from the scenario start until Vespyra crosses the outer marker for runways 16L, 16C and 16R.
- "Outer marker" is Titan Watch's phrase. Nobody has yet confirmed whether that is the point where aircraft on final are at risk, or the point where the field itself is.
- Titan Watch updates its track estimate every 30 seconds. The estimate is straight-line and does not model weather bursts.

Sensing, by source

Source	Sees	Does not see	Cadence
Titan Watch sensor grid	Position, heading, speed	Intent, weather response	Every 30 s
ATC primary radar	A large erratic return	What it is, its altitude with confidence	Continuous
Pilots	Visual contact inside about 15 km in daylight	Anything in cloud	On report
Public weather feed	Storm fronts	Vespyra	Every 10 min

No single source sees both where Vespyra is and what it is about to do.

Hard choice

Land everything onto runways in its path, or divert forty aircraft with fuel some of them do not have.

Not in this scenario

- Weapons, interception, engagement of Vespyra.
- Passenger terminal evacuation.
- Anything after Vespyra has passed.
